LIST OF CHEMICAL COMPOUNDS

Authorized for Use
Under USDA Poultry
and Poultry Products
Inspection Programs

LIST OF CHEMICAL COMPOUNDS AUTHORIZED FOR USE UNDER U. S. D. A. POULTRY AND
POULTRY PRODUCTS INSPECTION PROGRAM

This publication lists chemical compounds authorized by the Inspection Branch, Poultry Division, Agricultural Marketing Service for use in plants operating under the U. S. Department of Agriculture Poultry and Poultry Products Inspection Program.

*** THIS LIST IS COMPLETE AS OF JAN.1, 1965 ***

Procedure for Obtaining Compound Authorization

The manufacturer shall submit the following information on any chemical compound proposed for use in official poultry processing plants:

1. The complete name of each compound submitted.
2. A certification from the company stating that the compound, as it is proposed for use in the official plant, will not deleteriously affect the poultry or poultry products. This certification shall include the conditions under which this compound is believed to be satisfactory for use and any available technical information related to safety and efficacy which might aid in evaluating the compound and any precautions necessary.
3. The complete chemical formula for each compound, as well as the identification of all components by their complete chemical name in terms of percentages on a 100% basis, including the limits of any percentage variation which may occur.
4. One descriptive label for each product.
5. One 4-6 ounce sample of each compound.
6. A copy, if available, of any authorization for use issued by another Federal agency. For example, if the product is a pesticide, a copy of the authorization letter or registration number from the Pesticide Regulation Division of the U. S. D. A., Washington 25, D. C., should be submitted.
7. When the manufacturer and distributor are not the same, the distributor shall submit the following items in addition to the information required from the manufacturer:
 - a. A letter stating that they are authorized distributors of the compound.
 - b. One descriptive label for the compound.
 - c. One 4-6 ounce sample of the compound.

Any change in the above information voids the authorization unless new information is submitted for review prior to change.

The publication lists the compounds authorized for use in official poultry processing establishments and identifies by code letter the authorized usage of each compound and the conditions limiting the use of the compound.

The following are the code letters used and their meanings:

- A. Compounds for use in all departments as general cleaning agents or for use with steam cleaning or recirculating devices.
Before using these compounds, exposed food products and packaging materials must be removed from the room or protected. After using these compounds, equipment and utensils must be thoroughly rinsed with potable water before operations are resumed.
- B. Compounds for use only with steam cleaners or with recirculating devices in all departments.
Before using these compounds, exposed food products and packaging materials must be removed from the room or protected. After using these compounds, equipment and utensils must be thoroughly rinsed with potable water before operations are resumed.
- C. Acid cleaners for use in all departments.
Before using these compounds, exposed food products and packaging materials must be removed from the room or protected. After using these compounds, equipment and utensils must be thoroughly rinsed with potable water before operations are resumed.
- D. Floor and wall cleaners for use in all departments.
Before using these compounds, exposed food products and packaging materials must be removed from the room or protected. After using these compounds, equipment and utensils must be thoroughly rinsed with potable water before operations are resumed.
- E. Scouring cleansers.
Residues resulting from the use of abrasives and scouring cleansers must be removed from the equipment by a thorough rinsing with potable water. Special attention to thorough rinsing is required on the part of plant personnel because resident inspectors shall not permit abrasive residues.
- F. Sanitizers and sanitizing cleaners.
Sanitizers with a concentration of not more than 200 parts per million of available chlorine, iodine, or quaternary ammonium chloride compounds may be authorized for general use including the cleaning and sanitizing of equipment and utensils. Before operations are resumed, equipment and utensils must be thoroughly rinsed with potable water.
- G. Liquid hand soaps.
The hand soaps must be dispensed from adequate dispensers located on a wall away from the processing line. After the use of the soap, the hands must be thoroughly rinsed with potable water.

- H. Wetting agents for use in scald vats.
Wetting agents may be used in scald vats up to a maximum concentration of one (1) percent.
- I. Boiler treatment compounds.
Steam from boiler water treated with these compounds is allowed to contact edible products.
- J. Compounds for treating steam lines and closed cooling systems.
Steam or water from lines treated with these compounds is not permitted to contact edible products.
- K. Compounds for use in sewage and drain lines only.
- L. Compounds for use in toilets, dressing rooms, and plant exteriors only.
- M. Compounds for use in offal rooms and plant exteriors only.
Permission for the use of these compounds on loading docks and similar areas is left to the discretion of the inspectors in charge of the plants.

N. Insecticides - edible product areas.

The following insecticides may be used in all areas:

Deodorized petroleum distillate solutions containing the following:

Allethrins	Pyrethrum extract
Organic thiocyanates or lethanes	Rotenone
Pyrethrins	

Concentrations of 1% or less of the following insecticides, singly, or in combinations with other permitted insecticides:

Piperonyl butoxide	N-Propyl isome
N-Octyl dicycloheptane dicarboximide	Sulfoxide

Before using these insecticide compounds, exposed food products and packaging materials must be removed from the room or protected.

After using these compounds, equipment and utensils must be thoroughly rinsed with potable water before operations are resumed.

O. Insecticides - inedible product areas.

The use of these insecticides is limited to inedible product areas. The composition of these products may vary. They include, but are not limited to, compounds which consist of deodorized petroleum distillate solutions of chlorinated hydrocarbon, organic phosphate and carbamate insecticides.

Before using these insecticide compounds, exposed food products and packaging materials must be removed from the room or protected.

After using these compounds, equipment and utensils must be thoroughly rinsed with potable water before operations are resumed.

WARNING! These compounds may be dangerous if not used by trained personnel and in accordance with the manufacturer's directions.

P. Insecticides, rodenticides, fumigants for controlled usage.

Insecticides

Under circumstances which preclude contact with the product, the following substances (properly mixed with inert materials) may be used as insect powders:

Borax or boric acid

DDT powder (limited to areas where edible products are not handled)

Derris root

Powdered pyrethrum

Powders containing organic thiocyanates or lethanes.

Sodium fluoride (colored green or blue)

Baits shall not be placed in edible product areas until operations have ceased for the day. Strict account must be kept of the location and the number of baits set. Operations shall not be resumed until all the baits have been gathered and removed.

Rodenticides

The following rodenticides may be used under circumstances which absolutely preclude contact with edible products:

Antu

Red Squill

Barium carbonate

Warfarin

Baits shall not be placed in edible product areas until operations have ceased for the day. Strict account must be kept of the location and the number of baits set. Operations shall not be resumed until all the baits have been gathered and removed.

Fumigants

Permission for the use of fumigants such as methyl bromide gas or hydrocyanic gas must be obtained from the inspector in charge.

Fumigants are very dangerous and may be used only under the supervision of licensed, experienced operators. Poultry products and packaging materials must be removed from the rooms being treated. Before operations are resumed, sufficient ventilation must be provided to assure complete removal of the gases from equipment surfaces before operations are resumed. Thorough washing and a rinsing with potable water must follow fumigation procedures before operations are resumed.

W. Water conditioners

Compounds listed in this category are to be used in accordance with the conditions set forth in the letter of approval.

The granting of authorization to use marking inks, lubricants, paints, and coatings which do not come in contact with edible products or packaging materials is the responsibility of the inspector-in-charge of the official poultry processing plant. Technical assistance will be provided from the Washington Office on request.

The Poultry Division accepts water used in official establishments as being potable when such certifications are made by State Health Agency Authorities. Chemicals which have been accepted for use for total in-plant treatment of potable water supplies are chlorine to reduce bacterial population, phosphates as sequestering agents, and small amounts of silicates for adjusting pH of the water.

* * * * *

USE CHEMICALS SAFELY ---- READ THE LABEL

The insecticides, rodenticides, bactericides, and detergent compounds listed herein should be used only by trained personnel. These compounds should be stored in dry, well-ventilated space which is kept locked to prevent use by unauthorized persons.

Many of these chemical compounds are poisonous. They should not be placed where children or animals can reach them. Solutions of these compounds should not be allowed to drain into streams where they may endanger fish or wildlife.

Labels of pesticides and most other compounds contain adequate directions for safe use. These directions should be carefully followed at all times, and all necessary precautions taken.

USE CHEMICALS SAFELY ---- READ THE LABEL

QUALITY CONTROL can be described as the result of a total of factors which include proper selection of raw materials, careful handling, judicious processing, adequate packaging, and effective, consistent sanitation. Proper sanitation is as fully important as the latest in modern equipment.

Flies, roaches, dirty equipment, dirty utensils, piles of trash, strong odors, or accumulations of grease, all indicate unsanitary procedures. Unless the equipment or utensils are given a good cleaning, chemical disinfectants or sanitizers are not adequately effective. Their use is of little value in the presence of excess organic matter.

Detergents are mixtures of chemicals that change the characteristics of dirt and soil so that they can be separated from the surface of equipment with a solvent, usually water.

ALKALINE DETERGENTS will condition the water, penetrate and wet the soil, disperse and emulsify the soil so it can be washed away. The common ones are:

- sodium carbonate
- sodium hexametaphosphate
- sodium hydroxide
- sodium metasilicate
- sodium or potassium soaps
- tetrasodium pyrophosphate
- trisodium phosphate

ACID DETERGENTS are used primarily for removing scale formed from hard water precipitates. These are:

- mineral acids
- organic acids

SANITIZERS are chemicals which act as bactericides or fungicides to kill bacteria and fungi remaining on the surface after cleaning. These include:

- chlorine
- hydrogen peroxide
- iodine
- quaternary ammonium compounds

These cleaning compounds can be applied with brushes, spray cleaners, steam cleaners, and recirculating or pressure cleaners.
